Evidence Log

Team 3: Isaac Padilla, Juan Reyna, Karina Rivera

Evidence ID	Research Activity	Evidence Type
STR-01	Strava mobile teardown	Tier 1
INT-01	Boxing and recreational sports interview	Tier 1
INT-02	Piano and jewelry interview	Tier 1
INT-03	Golf Interview	Tier 1
STR-02	Skill Share teardown	Tier 1
STR-03	Strava Webpage Teardown	Tier 1

Strava Mobile App Teardown

Evidence ID	STR-01
Evidence Type	Tier 1 – Firsthand Observation
Method	Hands-on mobile application
Date	October 8, 2026
Duration	38 Minutes
Account	Free tier
Core Activity	Recording and reviewing physical activities
Ease of use	Simple registration process. The record tab takes you directly to GPS tracking, a timer, distance, and speed. You can also record past activities.
Key findings	GPS tracking, manual activity recording, progress statistics, streaks, badges for number of activities completed, challenges for activities, posting and sharing activities.
Observed Friction	Frequent subscription prompts and goals plus advanced statistics were part of paid subscription. Activity tracking mostly focused on the fitness measurements instead of development in technique or skill.

Boxing and Recreational Sports Interview

Evidence ID	INT-01
Evidence Type	Tier 1 – Firsthand Interview
Method	Interview
Date	October 13, 2026
Duration	13 Minutes
Activities	Boxing, soccer, and Tochito (flag football)
Competing Solutions	In-person boxing classes, coaching, and informal performance analysis
Reported Behavior	Participated in paid boxing classes where coaches set up different exercises and corrected techniques. Did not use formal method to record activity stats. Progress was measured through physical performance such

	as seeing ho much they were able to defend themselves, how much they could resist and hit.
Difficulties	Hard to identify how a tracking app could help with physical improvement. Hands on activities such as boxing are better done through in person instructions although online could help some people.
Key findings	Participant relied on practical performance and coach feedback instead of numerical stats to recognize improvement.

Piano and Jewely Interview

Evidence ID	INT-02
Evidence Type	Tier 1 – Firsthand Interview
Method	Interview
Date	October 13, 2026
Duration	12 Minutes
Activities	Piano and jewelry making
Competing Solutions	Phone galley, memory, and informal feedback
Reported Behavior	Participated in piano classes and performed at a concert. Improved by practicing unfinished piano pieces until completing it. Recorded a performance and stores the video on their phone but did not use it for reviewing. They also participated in jewelry making where their progress was measured by completed creations. They took no time in documenting or reviewing their progress.
Difficulties	Found it difficult to determine if improvement was happening. Frequently forgot information and suggested that writing down could help. Preferred keeping accomplishments private because sharing created pressure to perform better.
Key findings	Participant noticed improvement through the work they completed and personal evaluation instead of numerical stats. Their recordings and accomplishments could help them see their progress but they did not have a review process.

Golf Interview

Evidence ID	INT-03
Evidence Type	Tier 1 – Firsthand Interview
Method	Interview
Date	October 13, 2026
Duration	13 Minutes
Activities	Golf and previous boxing participation
Competing Solutions	Golf tracking application, video recordings, memory, and past boxing instruction.
Reported Behavior	Used a golf application during rounds to track strokes, distances, and scores. During practices, he recorded his golf swings and compared his

	angles themselves to check their technique. They used to do boxing but stopped due to work.
Difficulties	Found it difficult to recognize small improvements and finding adjustments they needed to make. Considered taking golf classes but didn't have the time.
Key findings	Participant used statistics to evaluate their golf performance but for actual technique improvement he relied to his recordings. Different methods helped to track different aspects of progress.

Evidence ID	STR-02
Evidence Type	Tier 1 – Firsthand Observation
Method	Website hands on
Date	October 10, 2026
Duration	59 Minutes
Account	Paid Subscription (Free 30-day Trial)
Core Activity	Learning how to draw and practicing
Ease of use	Simple registration, courses are laid out for you. Click on one and start the video lecture to begin. Each course has tabs with more information about the course and project.
Key findings	Online course taking, project-based submission. Achievements through badges based on course taking, not for each individual course. Project submissions are also posted for others to see. Discussion board for further discussion.
Observed Friction	Cannot take a class without a paid subscription. No courses for free tier accounts. Progress tracking is project submission; no actual tracking is provided.

Strava Webpage Teardown

Evidence ID	STR-03
Evidence Type	Tier 1 – Firsthand Observation
Method	Website hands on
Date	October 8, 2026
Duration	30 Minutes
Account	Free tier
Core Activity	Record a physical activity
Ease of use	Adding and recording activities are easy to use. However, navigating the website was somewhat confusing, as some processes felt repetitive while others lead to dead ends with no clear next steps. Also, the user interface feels outdated.
Key findings	One of the main features is being able to discover nearby events and activities through the map.

	For tracking activities, users can revisit and edit previously recorded activities, adjust their visibility settings, and upload related photoes or other media.
Observed Friction	The free version offers limited functionality. Most additional features, such as interactive map and more customizable features such as goals, requires users to upgrade to a paid subscription.

Everyday app Teardown

Evidence ID	STR-04
Evidence Type	Tier 1 – Firsthand Observation
Method	Hands-on application teardown
Date	October 15, 2026
Duration	30 Minutes
Account	Free tier
Core Activity	Tracking daily habits and maintaining consistency streaks
Ease of use	Extremely clean and minimal interface. Setting up custom habits is fast, and checking off daily tasks requires just a single tap on color-coded calendar grid.
Key findings	Visual calendar heatmaps, daily streak counters, consistency percentages, and customizable habit lists. It focuses purely on whether an action was completed each day rather than recording performance data.
Observed Friction	Everyday.app is strictly built around binary habit completion (did you do it or not?). It lacks any features for uploading media or recordings or analyzing techniques of growth for recreational skills. Streaks can also feel punishing when a user practices a hobby weekly rather than daily, especially if you do something that is completely weekly instead of daily. Not only that, but the free tier is really limiting, and it's kind of necessary to buy the premium tier if you want to genuinely use this app.
