Interview Notes - Jonathan

Interview 1 - Boxing and Recreational Sports

Behaviors

- Participated in touch football (Tochito), soccer, and boxing
- Last participated about a month ago, currently busy with school activities
- Plays sports at recreational centers in Juárez and visits a boxing gym close to home
- Got into boxing because it was recommended by a friend
- Participates with friends and in group training or sparring settings
- Pays for boxing classes
- Purchased boxing hand wraps and learned how to put them on properly from a coach
- Stopped going to a previous boxing membership because work and school got in the way
- Uses online resources such as YouTube and social media for tutorials and learning

Opinions & Key Takeaways

- **Gatekeeping:** Prefers not to recommend locations to new friends to keep fewer people around (something to keep in mind for platform design and community building)
- **Progress Tracking:** Does not formally track metrics with apps or step counters, mostly trains until tired or relies on subjective physical observation (e.g., better dodging in touch football, increased resistance and performance in boxing)
- **Tools & Apps:** Open to the idea of a viable tracking app, but currently relies on physical realization rather than digital logs
- **Instruction & Flexibility (Platform Relevance):** Views online instruction as a viable option when needed, though he strongly prefers hands-on learning for physical activities. This subjectivity highlights how people learn varies from person to person. Emphasizing this insight directly supports our product idea of making portfolio customization as expandable and adaptable as possible to accommodate diverse learning styles and user preferences

Interview 2 - Piano and Jewelry Making

Behaviors

- Took piano classes, with the last activity about three months ago

- Participated in an end-of-year piano concert
- Learned a piece, practiced it over the next year, and successfully completed it
- Recorded progress using phone videos and photos saved in the gallery, tracking the date and time
- Started playing after finding a spare keyboard at her grandmother's house
- Began jewelry making by experimenting and making earrings rather than using formal instruction
- Considered using a piano application, but ultimately did not use it
- Knows a friend who plays piano, tracks sheet notes, and understands improvements

Opinions & Key Takeaways

- **Measuring Progress:** Finds it difficult to know if skills are actually improving without external validation, relies on feedback from others and observing jewelry and creativity. This is a key thing to mention since it emphasizes another key aspect of our app, which is the ability to have people help you review your portfolio (from professionals to friends and family), which helps the individual progress.
- **Privacy vs. Sharing:** Prefers to keep accomplishments private to avoid pressure, though flexible to eventually sharing work (e.g., drawing courses, finished pieces). This applies to the social aspect of the app and how we need to make sure this type of preference is applied correctly without affecting other users.
- **Memory & Organization:** Notes that writing things down helps with memory since she otherwise relies on keeping track of things in her head. This emphasizes that the app is likely a good idea for many different people.

Interview 3 - Golf

Behaviors

- Participates in golf as a leisure activity (alongside watching movies and staying at home)
- Active for about two months, picks a golf course, schedules a tee time, and plays 9 or 18 holes
- Practices by hitting balls at the driving range weekly and playing on courses
- Uses a course golf-tracking application to record strokes, distances, and scores while playing

- Sometimes records swings to compare videos for technique adjustments, though it can be hard to spot fine details
- Got into golf as a spectator through a brother's friend
- Shares experiences and plays with others who enjoy golf

Opinions & Key Takeaways

- **Tracking & Apps:** Considers tracking apps viable and useful, noting that subscriptions offering advanced metrics (like ball speed and impact force) are common among other golfers. This could lead to adding a way for users to connect other apps for the tracking part of our app, allowing it to become the centralized hub for tracking multiple things.
- **Coaching & Lessons:** Interested in taking professional golf lessons to improve form and rely less on guesswork, but constrained by time availability. He likes the idea of taking lessons, which validates having instructor lessons offered directly in our app.
- **Improvement Assessment:** Relies on memory, comparing past sessions, range statistics, and video comparisons. This connects back to memory and organization, emphasizing that the app is likely a good idea for many different people.
