# Change Note and Candidate Risks

## Change Note

Our original success criterion was based on that high retention rates, where users consistently log activities and provide feedback for future improvements. But after doing research we have expanded to having users returning to review their previous activities, instead of only recording activities.

This changed since through our interviews we found that users could already see progress through personal experience and coaching without needing logging. They were also able to see accomplishments through their own works and recordings. We also found that there is a distinction between tracking statistics to see improvement and reviewing to see where we can improve, that work together to have a better overview of an individual's skill journey. If users return to review their previous accomplishments without adding anything new, that should still count as meaningful engagement with SkillUp.

## Candidate Risks

Candidate Risk – R1

| Field | Details |
|---|---|
| Risk | Potential users might prefer their current applications or informal tracking methods if SkillUp does not offer enough value to make it worth switching to. |
| Trigger | During interviews, some participants showed little interest in recording their activities in a formal way because they could already recognize their progress through personal experience, while others did use existing applications |
| Owner | Market Researcher |
| Mitigation | Compare SkillUp to more existing solutions and test what motivates them to actual use it. |
| Evidence | STR-01, INT-01, INT-03 |
